

Portable, Heavy Duty Trackways

Deployed In Minutes

Sand, fields, woodland, marshland, whatever the subsoil, with FlexRoad we can roll out a portable road within 10 minutes creating a Heavy Trackway, made from woven steel wire, spring-steel and polypropylene. After which, you can safely move any vehicle varying from heavy construction equipment to luxury cars.

Because our Heavy Trackway matting only weighs 15kg per square metre, we can deploy it quickly and easily with our Fast Deployment Tool. We connect sections of 25 or 30 metres long in a linear direction to create virtually any length of road with a standard width of 4 metres wide. The light porous material makes sure the soil beneath still receives light, air and water and is not completely covered, sustaining as little damage as possible.

FlexRoad UK is your service supplier in temporary infrastructure. In a very short time frame we can provide a temporary road, boat ramp, access road, hard standing or parking area. We offer our services to all branches that have occasional need for ground improvement such as farmers, contractors, festivals & events, public services or local authorities. FlexRoad aims to provide you with rental services to solve your temporary mobility problems.

FlexRoad
